                                                                                                Genes with similarity to proteins in the databases are described as putative, '-like' or 'similar to'. Genes that have EST similarity but no significant protein similarity are described as 'unknown proteins'. Genes that are annotated based only on gene prediction software are described as 'hypothetical proteins'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/section/index.html), GENSCAN (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANN.html), Fexa (V.Solovyev & A.Salamov, Sanger Centre, http://genmic.sanger.ac.uk/), and NetPlantGene (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/NetPlantGene.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Federspiel, N.A., Palm, C.J., Conway, A.B., Conn, L., Hansen, N.F., Altafi, H., Araujo, R., Huizar, L., Rowley, D., Buehler, E., Dunn, P., Gonzalez, A., Kremenetskaia, I., Kim, C., Lenz, C., Li, J., Liu, S., Luros, S., Schwartz, J., Shinn, P., Toriumi, M., Vyotskaia, V., Walker, M., Yu, G., Ecker, J., Theologis, A. and Davis, R.W.

              Submitted (20-JUL-2000) The Institute for Genomic Research, 9 Medical Center Dr., Rockville, MD 20850, USA, cdtown@tigr.org * NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The aromatic acyl transferase acylates the pigments in the flower resulting in color changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in 737308-737313. NOTE: This sequence is supposed to cross reference with the protein describe in W04727, however there are so many discrepancies between the polypeptide decoded from this sequence and the polypeptide given the specification and described in W04727 that the indexer decide not the cross reference with the the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the cross reference with the protein described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and described in W04727 that the indexer decide not the specification and the s

                                                                                                                                                                                                                                                                                                                                                                                            Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in T37308-T37313.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 4; Page 65-69; 94pp; Japanese

                                                                                                                                             Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colouratione changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in T37308-T37313.

                                                                                      Vectors containing DNA fragments encoding proteins of plant original with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in T37308-T37313.
                                                                                                                                                                                                                                                                                                                                                                            30-JAN-1996;

The aromatic acyl transferase acylates the pigments in the flower resulting in cotone changes and allowing new colourations to be produced. Sispecific DNA sequences encoding aromatic acyl transferase from different plants are described in T37308-T37313.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel nucleic acids (I; designated LOBO (long bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The nucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The methods and nucleic acid molecules, etc. are useful for production of transgenic animals, especially a transgenic mouse for the study of diseases associated with bone development, e.g. spondyloepiphysal dysplasia and achondroplasia. This sequence encodes a human LOBO protein described in the method of the invention.
                                                                                                                                                                                                                                                      diagnostic; pharmaceutical; gene spondyloepiphysal dysplasia; acho

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel nucleic acids (I; designated LOBO (long bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The nucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The method and nucleic acid molecules, etc. are useful for production of transgenia animals, especially a transgenic mouse for the study of diseases associated with bone development, e.g. spondyloepiphysal dysplasia and achondroplasia. This sequence encodes a human LOBO protein described in the method of the invention.

The GBP130h gene and its homologues can be used in vaccines to protect against malaria caused by P.falciparum. The coding sequence was isolated using PCI techniques on a genomic P.falciparum FCBR strain library. The GBP130h gene was found to be highly conserved between different Strains but is distinct from the GBP130 gene.

Shuttle vector pMUW1630 was constructed for use in E. coli and transfer back into Dictyostelium. It includes a fragment of the Dictyostelium plasmid Ddp2 containing the origin of replication, encoding the secretion signal peptide of the D19 gene, a sequence PsA, Actin 15 polyA signal and an ampicilline resistance conferring sequence. See also Q11710 and Q11711.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primers and probes which may be used in the diagnosis of viral, bacterial or fungal infections, allergic responses; hereditary disease, lymphoma or carcinoma or other conditions which activate genes of the lymphoid tissue. Inhibitors of HEDG, e.g. HEDG-specific antibodies, can be used to treat inflammation or disease as described above. Inhibitors of HEDG are also useful for controlling signal transduction in rheumatoid synovium (from where it is derived)

10

T48669 is a cDNA sequence encoding homologue, HEDG. The cDNA sequence

the

human EDG-2 be used for

receptor the production

of

Claim 2; Page 25; 35pp; English.

New isolated human EDG-2 receptor homologue - used to develop prods for the diagnosis or treatment of inflammation or diseases which activate genes of lymphoid tissues.

WPI; 1997-087379/08. P-PSDB; W10879.

                                                          clag genetic species, and the products encoded by them, enables range of therapeutic agents to be rationally designed and/or identified that are useful for the prophylaxis and treatment of disease conditions caused or exacerbated by infection with plasmodium spp., e.g. malaria, especially in humans.
                                                                                                               This is the nucleotide sequence of a clag9 paralogue gene on chromosome 3 of Plasmodium falciparum. It is a paralogue of the newly identified cytoadherence linked asexual gene 9 (clag9) on chromosome 9 of P. falciparum. The clag9 gene encodes a protein (see Y31945) that facilitates cytoadherence of erythrocytes parasitised with Plasmodium to other cells. The identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1946

                                                                                                                                                                                             The DNA is of a malaria-specific DNA insert of clone 41-2. The encoded peptide (see P90417) is useful in a protective vaccine, esp. against malaria. Produced antibodies are useful for passive immunisation, and antibodies, the protein and the DNA sequence are useful as diagnostic reagents. See also N90211-25 and P90403-19.

NOTE: This sequence is supposed to cross reference with the protein described in w04727, however there are so many discrepanteles between the polypeptide decoded from this sequence and the polypeptide discrebed in W04727 that the indexer decided the specification and described in W04727 that the indexer decided
                                                                                                                                                                                                                                                                                                             WPI;

                      This cDNA sequence encodes the TRP-185 protein, a 185 kD specific cellular protein that regulates HIV gene expression by binding a transactivating RNA region (TAR) of the Human Immunodeficiency Virus long terminal repeat (HIV LTR). The structural integrity of 'TAR RNA stem, loop and bulge regions is a key element for the activation of the viral transactivating protein tat, which reportedly binds to the TAR bulge region via its basic domain. Binding of the TRP-185 to the TAR region of HIV RNA increases the transcription of wild-type HIV LTR resulting in a four-fold increase in the replication of the virus. This protein can be used to produce antigenic polypeptides which can be used to study HIV and cellular gene expression or in the preparation of immunodiagnostic agents and therapeutic agents (i.e. inhibitors) for the treatment of HIV related diseases (e.g. AIDS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1458
